

Management & Analytics

The IBM Db2 Analytics Accelerator (IDAA) is a workload optimized appliance enabling the integration of business insights into operational processes driving winning strategies

Success in any enterprise depends on having the best available information in time to make sound decisions. Obtaining the right information at the right time is now mission critical. Data continues to expand exponentially. Analytics are becoming more complex as business demands faster answers.

Business intelligence and analytics systems are being pushed beyond their limits. The IT resources required to support them are constrained, complex to maintain, and costly to operate. Businesses need solutions that can keep up with the ever-increasing demand.

The IBM Db2 Analytics Accelerator for z/OS based on the premier IBM analytical engine, Db2 Warehouse software is the data warehouse appliance that is designed specifically for running complex analytics on very large data volumes with hybrid transaction and analytic processing (HTAP) environment, orders of magnitude faster than competing solutions.

The simple deployment and maintenance enables a proof of concept program that makes it easy to experience this high performance data warehouse appliance on-site, with real data.

This appliance easily integrates with Db2 on z/OS, your preferred ETL and BI tools such as IBM InfoSphere DataStage and Cognos Business Intelligence as well as numerous other non-IBM solutions using industry standard interfaces.

Even if you don't have a data warehouse infrastructure in place today, IDAA technology can help you take the data that you already process in a simple way and transform that data into information that can be used to increase the efficiency of your business.

VICOM INFINITY MANAGEMENT AND ANALYTICS DELIVER VALUE:

- Can be deployed as a standalone appliance or integrated with IBM z14
- Extreme Performance for Complex Business Analysis
- Unprecedented response times for "right-in-time" analysis
- Complex queries in seconds rather than hours, transparent to the application
- Inherits all System z Db2 attributes
- No need to create or maintain indices
- Eliminate query tuning
- Fast deployment and time-to-value
